

brand name bags for cheap

Let's use the same example from FanDuel.

If you bet \$100, you'll win \$300.

In addition to setting a line for the favorite and the underdog, oddsmakers will

also set a total number of points scored in a game by both teams combined.

NFL spreads will usually be -110 on both sides.

5 for the favorite and +1.

5 for the underdog, the juice will differ depending on the gap in ability between

the two teams.

To bet USC, just click the cell across from its name.

Comments on the fake Microsoft Authenticator browser extension show the reviews

for these applications are either positive or very negative - basically calling

it out as a scam. Image: chrome-stats.com.

After hearing from a reader about a phony Microsoft Authenticator extension that

appeared on the Google Chrome Store, KrebsOnSecurity began looking at the profile

of the account that created it. There were a total of five reviews on the extension

before it was removed: Three Google users gave it one star, warning people to

stay far away from it; but two of the reviewers awarded it between three and

four stars.

"It's great!" the Google account Theresa Duncan enthused, improbably.

"I've only had very occasional issues with it."

Google's Chrome Store said the email address tied to the account that published

the knockoff Microsoft extension also was responsible for one called "i

Artbook Digital Painting." Before it was removed from the Chrome Store, iArtbook

had garnered just 22 users and three reviews. As with the knockoff Microsoft

extension, all three reviews were positive, and all were authored by accounts

with first and last names, like Megan Vance, Olivia Knox, and Alison Graham.

-45 malicious extensions that collectively had close to 100,000 downloads

Unlike malicious browser extensions that can turn your PC into a botnet or harvest

your cookies, none of the extensions examined here request any special permissions

from users. Once installed, however, they invariably prompt the user to provide

personal and financial data - all the while pretending to be associated with

major brand names.

Additionally, Google's account recovery tools indicate many different developer

email addresses tied to extensions reviewed here share the same recovery email

- suggesting a relatively few number of anonymous users are controlling the entire

scheme. When the spreadsheet data shown above is sorted by email address of

the extension developer, the grouping of the reviews by date becomes even clearer.

rer.

As this story illustrates, it pays to be judicious about installing extensions.

Leaving aside these extensions which are outright fraudulent, so many legitimate

extensions get abandoned or sold each year to shady marketers that it's wise
